The specific aims include: 1) to determine the structural relationship between erythroid progenitors and myeloid progenitors in murine and human hematopoietic cell suspensions; 2) to characterize the cellular and molecular interactions between erythroid and myeloid progenitors by co-culturing these two cell types; 3) to determine the morphologic and biochemical events involved in the induction of maturation of erythroid progenitors in vitro; and 4) to determine the chromosomal constitution of myeloid and erythroid cells. These studies involve a combination of morphologic, biochemical, and immunologic techniques. The direct interactions of myeloid and erythroid cells will be analyzed in vitro and in vivo. The role of interleukin-3 in the control of erythroid cell maturation and the possibility that lymphocytes and/or adherent cells regulate the erythroid microenvironment will be studied. Chromosome studies of

bone marrow cells are being used to analyze the chromosomal constitution of myeloid and erythroid progenitors in human and mouse bone marrow.Q: Why does not show me error in "returning" this method In the code below I want to get the user data from my database and return them to the user.
